A Heat-Transfer Example with MPI  
Slide 1 Höchstleistungsrechenzentrum Stuttgart

H L R I S

## Goals

- first complex MPI example
- exercise with basic MPI features
- base for your own applications

A Heat-Transfer Example with MPI  
Slide 2 Rolf Rabenseifner  
Höchstleistungsrechenzentrum Stuttgart

H L R I S

## Heat: MPI features

- block data decomposition
- communication: filling the halo with
  - non-blocking point-to-point
  - blocking MPI\_SENDRECV
  - MPI\_ALLTOALLV
- and for the abort-criterion
  - MPI\_ALLREDUCE
  - usage of message tags in point-to-point communication
  - MPI\_BCAST
- derived datatypes: MPI\_TYPE\_VECTOR
- Minor features: MPI\_ADDRESS(), MPI\_BOTTOM, topologies, MPI\_PROC\_NULL, MPI\_Wtime()
- Performance

A Heat-Transfer Example with MPI Rolf Rabenseifner  
Slide 3 Höchstleistungsrechenzentrum Stuttgart

H L R I S

## Heat Conduction Program - an Example

- solves the partial differential equation for unsteady heat conduction  $df/dt = \Delta f$
- uses an explicit scheme: forward-time, centered-space
- solves the equation over a square domain
- initial conditions:  $f=0$  everywhere inside the square
- boundary conditions:  $f=x$  on all edges
- number of grid points: 80x80
- based on Parallel CFD Test Case  
[www.hlrn.de/people/resh/PROJECTS/PARACFD.html](http://www.hlrn.de/people/resh/PROJECTS/PARACFD.html)
- Aims of this session:
  - how to parallelize the example
  - to recapitulate most of the MPI methods

A Heat-Transfer Example with MPI Rolf Rabenseifner  
Slide 4 Höchstleistungsrechenzentrum Stuttgart

## Fortran Introduction for C Programmers

- Array declaration:
  - `type array_name ( first_index_dim1 : last_index_dim1, first_index_dim2 : last_index_dim2, ... )`
  - `aaa(17)` means `aaa(1:17)`
- Memory layout: the first index is contiguous
- Using the array:
  - one element: `array_name( i1,i2,... )`
  - sub-array: `array_name (first_sub_index1 : last_sub_index1, first_sub_index2 : last_sub_index2, ... )`
  - referencing:
    - the whole array by the `array_name`
    - a contiguous subarray by the fist element `array_name( i1,i2,... )`
- Logical operations: `.gt.` / `.lt.` means greater / less than  
`.ge.` / `.le.` means greater / less than or equal to  
`.eq.` / `.ne.` means equal / not equal to

## Heat: Sequential Program — Scheme

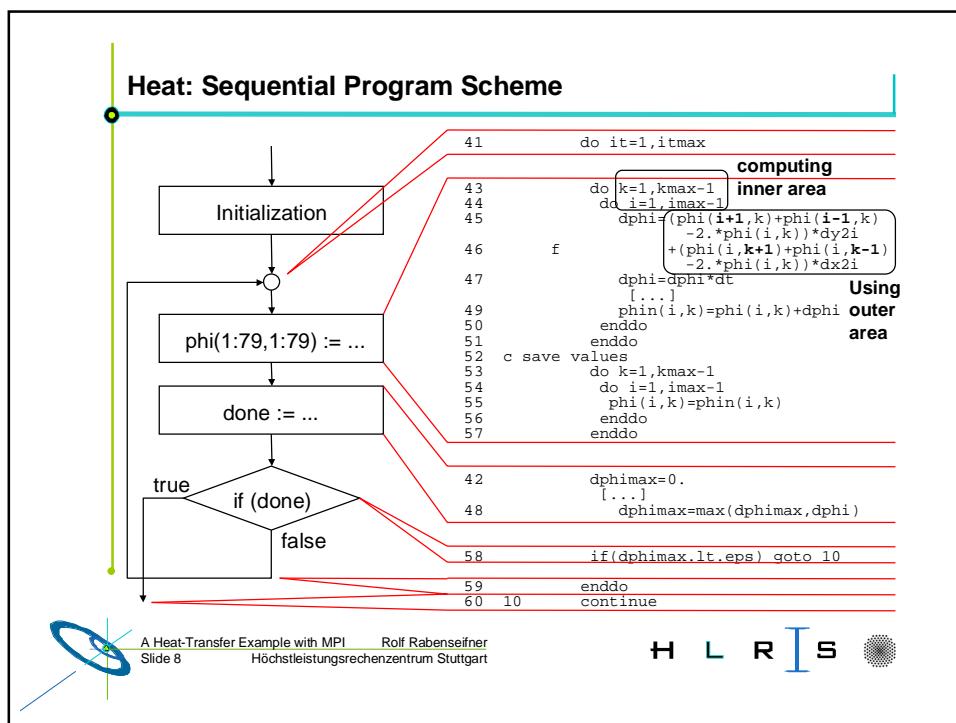

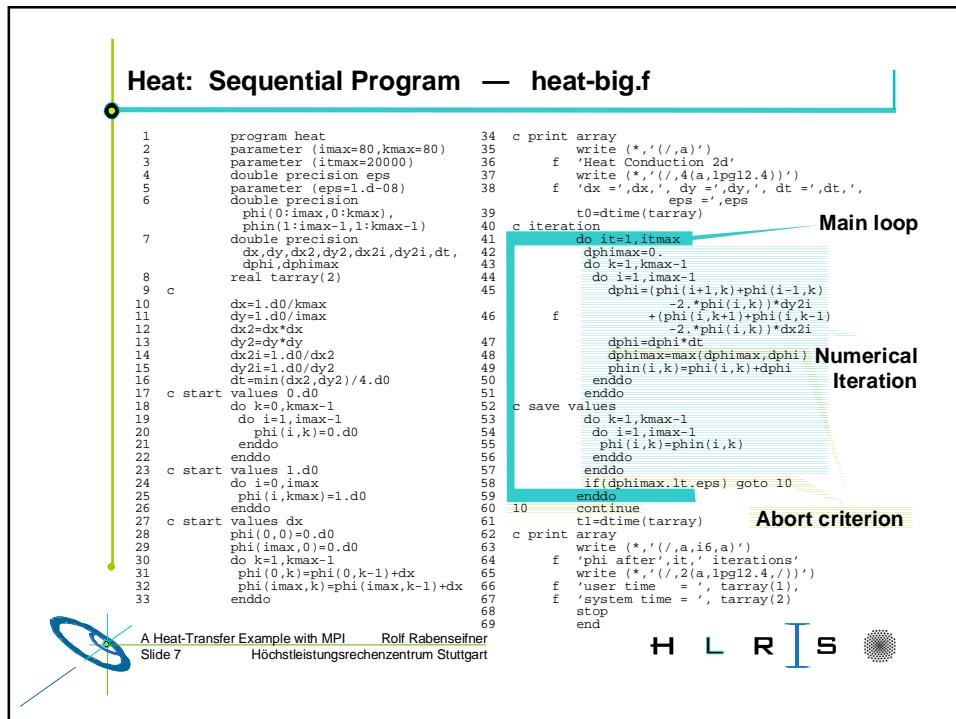

A Heat-Transfer Example with MPI Rolf Rabenseifner

Slide 6

Höchstleistungsrechenzentrum Stuttgart

H L R I S

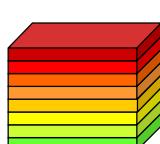

## Heat: How to parallelize with MPI

- Block data decomposition of arrays phi, phin
  - array sizes is variable, depends on processor number
- Halo (shadow, ghost cells, ...)
  - to store values of the neighbors
  - width of the halo := needs of the numerical formula (heat: 1)
- Communication:
  - fill the halo with values of the neighbors
  - after each iteration ( $dt$ )
- global execution of the abort criterion
  - collective operation

A Heat-Transfer Example with MPI Rolf Rabenseifner  
Slide 9 Höchstleistungsrechenzentrum Stuttgart

H L R I S

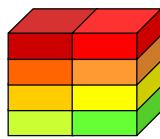

## Block data decomposition — in which dimensions?

### Splitting in

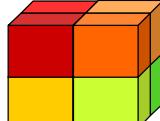

- one dimension:  
communication  
 $= n^2 * 2 * w * 1$

w = width of halo  
n<sup>3</sup> = size of matrix  
p = number of processors  
cyclic boundary  
→ two neighbors  
in each direction

- two dimensions:

$$\text{communication} = n^2 * 2 * w * 2 / p^{1/2}$$

- three dimensions:

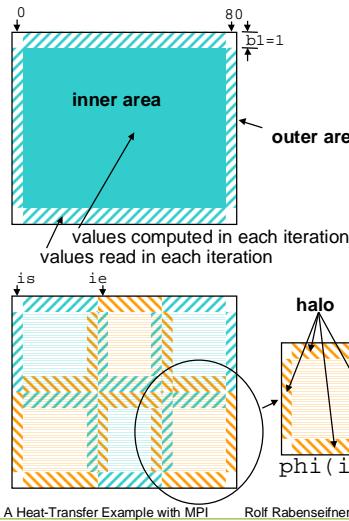

$$\text{communication} = n^2 * 2 * w * 3 / p^{2/3}$$

optimal for  $p > 11$

A Heat-Transfer Example with MPI Rolf Rabenseifner  
Slide 10 Höchstleistungsrechenzentrum Stuttgart

H L R I S

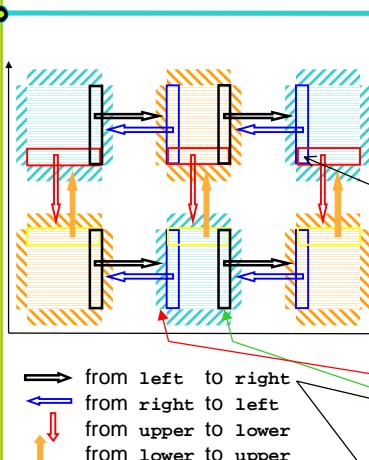

## Heat: How to parallelize with MPI - Block Data Decomposit.

- Block data decomposition
- Cartesian process topology
  - two-dimensional  
 $\text{size} = \text{idim} * \text{kdim}$
  - process coordinates  
 $\text{icoord} = 0 .. \text{idim}-1$   
 $\text{kcoord} = 0 .. \text{kdim}-1$
  - see heat-mpi-big.f, lines 18-42
- Static array declaration  
-> dynamic array allocation
  - $\text{phi}(0:80,0:80) \rightarrow \text{phi}(\text{is}:\text{ie}, \text{ks}:\text{ke})$
  - additional subroutine "algorithm"
  - see heat-mpi-big.f, lines 186+192
- Computation of  $\text{is}$ ,  $\text{ie}$ ,  $\text{ks}$ ,  $\text{ke}$ 
  - see heat-mpi-big.f, lines 44-98

H L R I S

## Heat: Communication Method - Non-blocking

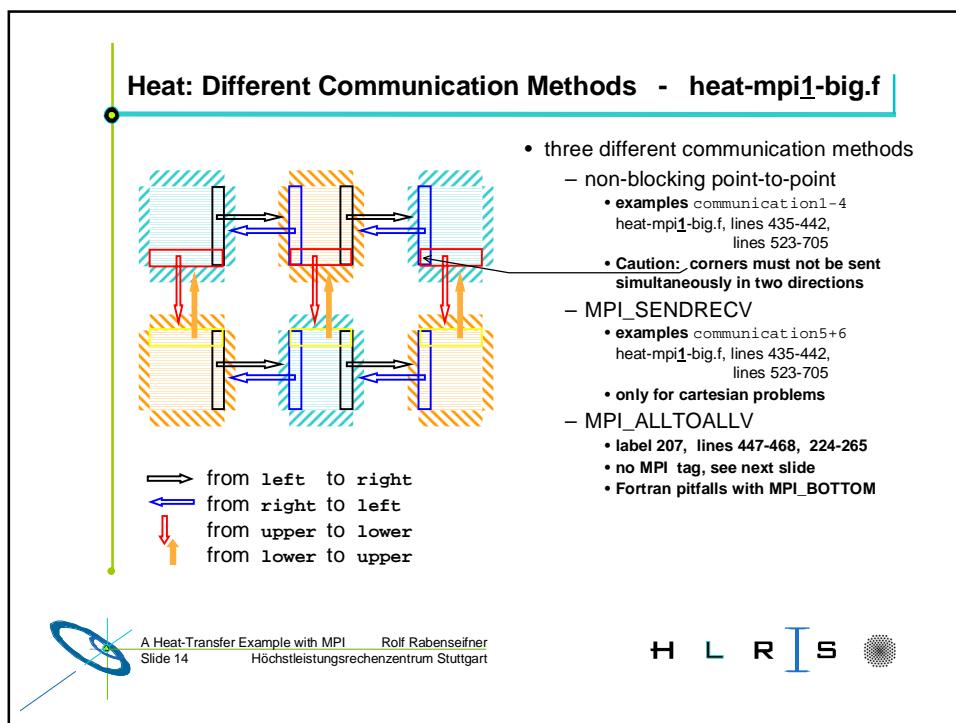

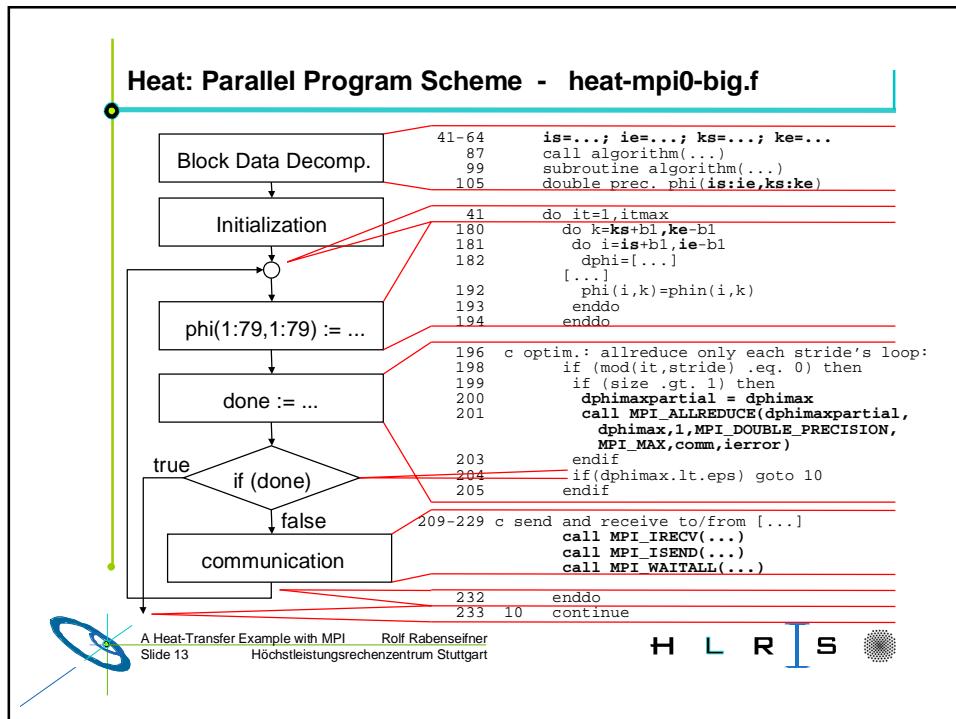

- Communicate halo in each iteration
- Ranks via MPI\_CART\_SHIFT
 

```
114 call MPI_CART_SHIFT(comm,  
          0, 1, left, right, ierror)  
115 call MPI_CART_SHIFT(comm,  
          1, 1, lower, upper, ierror)
```
- non-blocking point-to-point
  - Caution: corners must not be sent simultaneously in two directions
- vertical boundaries:
  - non-contiguous data
  - MPI derived datatypes used

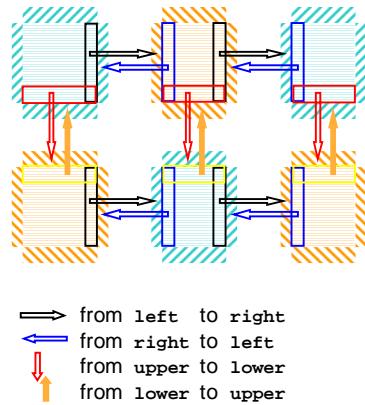

```
118 call MPI_TYPE_VECTOR(  
    kinner,b1,iouter,MPI_DOUBLE_PRECISION,  
    vertical_border, ierror)  
120 call MPI_TYPE_COMMIT(  
    vertical_border, ierror)
```
- horizontal boundaries
 

```
221 call MPI_ISEND(phi(is,ks+b1),  
    1,vertical_border,  
    left,MPI_ANY_TAG,comm, req(1),ierror)  
225 call MPI_RECV(phi(ie-b1,ks+b1),  
    1,vertical_border,  
    right,0,comm, req(3),ierror)
```

H L R I S

## Heat: sending non-contiguous data - heat-mpi1-big.f

two methods for vertical boundaries:

- MPI derived datatypes (comm. 1-5)
  - some MPI implementations are slow
- local copying (comm. 2-7)
  - non-contiguous array is copied to contiguous scratch array
  - scratch array is sent with MPI
  - may be executed fast
    - optimized by the compiler
    - vectorized
    - automatically multi-threaded parallelized
    - multi-threaded parallelized with OpenMP

A Heat-Transfer Example with MPI Rolf Rabenseifner  
Slide 15 Höchstleistungsrechenzentrum Stuttgart

H L R I S

## Heat: Non-blocking point-to-point with derived datatypes (1)

```

214 c create a MPI Vector
215   call MPI_TYPE_VECTOR(kinner,b1,iouter, MPI_DOUBLE_PRECISION,
216     vertical_border,ierror)
217   call MPI_TYPE_COMMIT(vertical_border, ierror)
218
219   call MPI_TYPE_VECTOR(b1,iinner,iouter, MPI_DOUBLE_PRECISION,
220     horizontal_border,ierror)
221   call MPI_TYPE_COMMIT(horizontal_border, ierror)

535   f   call MPI_IRecv(phi(is+b1,ks),1,horizontal_border,
536     lower,MPI_ANY_TAG,comm, req(2),ierror)
537   f   call MPI_IRecv(phi(is+b1,ke),1,horizontal_border,
538     upper,MPI_ANY_TAG,comm, req(1),ierror)
539   f   call MPI_ISEND(phi(is+b1,ke-b1),1,horizontal_border,
540     upper,upper_right_tag,comm, req(3),ierror)
541   f   call MPI_ISEND(phi(is+b1,ks+b1),1,horizontal_border,
542     lower,lower_left_tag,comm, req(4),ierror)
543   f   call MPI_WAITALL(4, req, sts_upper, ierror)

550   f   call MPI_IRecv(phi(is,ks+b1),1,vertical_border,
551     left,MPI_ANY_TAG,comm, req(2),ierror)
552   f   call MPI_IRecv(phi(ie,ks+b1),1,vertical_border,
553     right,MPI_ANY_TAG,comm, req(1),ierror)
554   f   call MPI_ISEND(phi(ie-b1,ks+b1),1,vertical_border,
555     right,upper_right_tag,comm, req(3),ierror)
556   f   call MPI_ISEND(phi(is+b1,ks+b1),1,vertical_border,
557     left,lower_left_tag,comm, req(4),ierror)
558   f   call MPI_WAITALL(4, req, sts_right, ierror)

```

## Heat: Parallel Abort Criterion

- Three methods:
  - MPI\_ALLREDUCE**
    - exact implementation of the sequential code
    - very expensive
    - less expensive, if not computed in each iteration:  
using variable stride
    - computing efficient stride needs knowledge about  
number of iterations, execution time of MPI\_ALLREDUCE, and  
execution time of one iteration without allreduce:  
 $\text{stride}_{\text{optimal}} = \sqrt{\text{iterations} * \text{time\_allreduce} / \text{time\_exec}}$
  - Computing local abort-criterion**
    - using the MPI message tag to send the criterion to the neighbors
    - problems if abort-criterion is locally fulfilled on some PEs in the first iterations,  
see ① on next slide
  - Computing global abort-criterion** by communicating the local  
abort-criterion via message tags from lowest to highest node  
and backward

A Heat-Transfer Example with MPI Rolf Rabenseifner  
Slide 21 Höchstleistungsrechenzentrum Stuttgart

## Heat: Summary (1)

- block data decomposition
- communication: filling the halo with
  - non-blocking point-to-point
  - blocking MPI\_SENDRECV
  - MPI\_ALLTOALLV
- and for the abort-criterion and interactive input
  - MPI\_ALLREDUCE
  - usage of message tags in point-to-point communication
  - MPI\_BCAST
- derived datatypes: MPI\_TYPE\_VECTOR

A Heat-Transfer Example with MPI Rolf Rabenseifner

## Heat: Summary (2)

- absolute addressing with MPI\_ADDRESS and MPI\_BOTTOM and problems with Fortran language binding and MPI (see MPI-2, pages 289f)
- MPI topologies: MPI\_CART\_CREATE / \_COORDS / \_SHIFT
- Null processes for not existing neighbors: MPI\_PROC\_NULL see MPI 1.1, Chapter 3.11, pages 60f)
- timer: MPI\_WTIME
- performance of different communication methods

### Practical (a)

- cp ~/MPI/course/F/Ch7/ring.f .  
C ring.c .
- make two-dimensional topology
  - splitting "size" with MPI\_DIMS\_CREATE()
  - cyclic in the first dimension
  - linear in the second dimension
- compute and print the sum of the original Cartesian ranks separately in each ring
- please, discuss and implement the best choice for large scale systems, i.e., expect that the computation is repeated very often and hundreds of processors are used
- your trainer will come to look at your decisions

### Practical (a) — Background, I.

- MPI\_Dims\_create:
  - int MPI\_Dims\_create(int nnodes, int ndims, int \*dims);
  - SUBR. MPI\_DIMS\_CREATE(nnodes, ndims, dims, ierror)  
INTEGER nnodes, ndims, dims(ndims), ierror
  - ndims := number of dimensions in dims, e.g., := 2
  - dims(...) must be initialized with zero, e.g., (0,0)
  - nnodes := size of MPI\_COMM\_WORLD, e.g., := 12
  - result: dims contains a balanced distribution, e.g., (4,3)
- MPI\_Cart\_create:
  - „dims“ and „periods“ are now arrays!
- Expected results:
  - size=4 => dims=(2,2) => sums = (2,4)
  - size=6 => dims=(3,2) => sums = (6,9)
  - size=12 => dims=(4,3) => sums = (18,22,26)

### Practical (a) — Background, II.

- Ranks and **Cartesian process coordinates** in `comm_cart`
- 
- Ranks in `comm` and `comm_cart` may differ, if `reorder = 1` or `.TRUE.`.
  - This reordering can allow MPI to optimize communications

H L R I S

### Practical (a) — Background, III.

- Ranks and **Cartesian process coordinates** in `comm_sub`
- 
- `MPI_Cart_sub( comm_cart, remain_dims, comm_sub, ierror )`  
(true, false)

### Heat: Practical (b)

- cp ~/MPI/course/F/heat/\* .
- Compile heat-mpi0-big.f and run it on 1, 4, 8 and 9 PEs and notify the execution time
- Compute the speedup and efficiency (e.g. with xcalc)
- Which speedup and efficiency do you expect for 16 PEs?
- Switch on the printing of the result (line 87)
- Compile heat-mpi0-big.f and run it on 4 PEs and verify the output

### Heat: Files for Practical (b)

- All examples with 80x80 array
- ~/MPI/course/F/heat/heat-big.f  
heat-mpi0-big.f  
heat-mpi1-big.f
  - ~/MPI/course/C/heat/heat-big.c  
heat-mpi-slow-big.c  
heat-mpi-fast-big.c
